

"Still bolting clips in the field?"

If you're erecting buildings that have you bolting on clips at the job site, we think it's time you took a closer look at Corle Building Systems.

Clips for all purlins and girts on Corle buildings are welded in-plant and precisely placed with zero tolerance for error, resulting in dimensionally correct alignment. The clips are welded by skilled, AWS certified welders, eliminating extra fitting of parts in the field and reducing the chance of misplaced or misaligned parts. It also saves time and money through faster, more accurate erection.

Corle buildings are contractor-friendly metal buildings because they are designed and manufactured from a builder's perspective. Long before we became a manufacturer, we were a metal building contractor. Our contractor heritage means we understand your needs.
